Common Questions and Answers from Chapter 18

Here are some typical problems and their solutions from Pearson Chemistry Chapter 18, based on the answer key.

Question 1: How does temperature affect reaction rate?

Answer: According to the Arrhenius equation, an increase in temperature results in a higher reaction rate. This is because higher temperatures provide reactant molecules with more kinetic energy, increasing the frequency of effective collisions. For example, a 10°C rise typically doubles the reaction rate, though this varies depending on the reaction.

Question 2: Derive the rate law for a reaction with the following mechanism:

- Step 1: $A + B \rightarrow C$ (slow)
- Step 2: $C + D \rightarrow E$ (fast)

Answer: Since the first step is slow, it is the rate-determining step. The rate law is:

$$\text{Rate} = k [A][B]$$

Because the second step is fast, it does not affect the overall rate. The overall reaction rate depends on the concentrations of A and B, as indicated.

Question 3: What is the effect of a catalyst on the activation energy?

Answer: Catalysts lower the activation energy (E_a) of a reaction. By providing an alternative pathway with a lower E_a , catalysts increase the reaction rate without being consumed in the process.

Question 4: How do you determine the reaction order from experimental data?

Answer: Reaction order can be determined by analyzing the concentration vs. time data and using methods such as:

- The method of initial rates
- Integrated rate laws
- Graphical methods (e.g., plotting $1/[A]$ vs. time for second-order reactions)

The slope and intercepts from these plots help determine the reaction order and rate constant.
