### Basic Level Questions

Q1: How do you create a basic formula to add the values in cells A1 and B1?

Answer:

Type the formula `=A1+B1` into the cell where you'd like the sum to appear, then press Enter. This simple addition formula instructs Excel to sum the contents of cells A1 and B1 dynamically.

Q3: How do you use the VLOOKUP function to find a value in a table?

Answer:

VLOOKUP (Vertical Lookup) searches for a value in the first column of a table and retrieves corresponding data from another column.

Syntax:

`=VLOOKUP(lookup_value, table_array, col_index_num, [range_lookup])`

Example:

Suppose you have a product list in cells A2:C100, where column A contains product IDs, and column C contains prices.

To find the price of product ID "P123", you would write:

`=VLOOKUP("P123", A2:C100, 3, FALSE)`

- `lookup_value`: the product ID you're searching for.
- `table_array`: the range containing your data.
- `col_index_num`: the column number from which to retrieve data (3 for price).
- `[range_lookup]`: FALSE for an exact match.

Key Tips:

- Ensure the lookup column (A in this case) is sorted if using TRUE for approximate matches.

- VLOOKUP searches from left to right; for more flexible lookups, consider INDEX/MATCH.

Q4: How can you filter data in Excel to display only rows that meet certain criteria?

Answer:

Use the Filter feature:

- Select your data range.
- Go to the Data tab.
- Click Filter.
- Dropdown arrows will appear in the header row.
- Click the arrow for the relevant column and select criteria (e.g., values greater than a certain number, specific text).

This process dynamically displays only the rows matching your filter criteria, which is essential for data analysis and reporting.

## Advanced Level Questions

Q5: How do you create a pivot table to summarize sales data?

Answer:

Pivot tables are powerful tools to analyze large datasets efficiently.

Steps:

- Select your data range.
- Go to the Insert tab and click PivotTable.
- In the dialog box, choose whether to place the pivot table in a new worksheet or existing sheet.
- Drag relevant fields into the Rows, Columns, Values, and Filters areas.

Example:

- Drag "Product Category" to Rows.
- Drag "Sales Amount" to Values (default sum).
- Optionally, drag "Region" to Columns or Filters.

This setup provides a dynamic summary of sales per category and region, which can be updated instantly by changing filters or field arrangements.

Q6: How do you write a nested IF formula to categorize data?

Answer:

Nested IF statements allow complex decision-making in Excel.

Example:

Suppose you want to categorize sales performance:

- Sales > 1000: "Excellent"
- Sales between 500 and 1000: "Good"
- Sales

The formula:

```excel

=IF(A2>1000,"Excellent",IF(A2>=500,"Good","Needs Improvement"))

```

This formula checks the first condition; if false, moves to the second, and defaults to the last category if all conditions fail.

Expert Tip: For complex nested conditions, consider using the IFS function (Excel 2016+), which improves readability.
