## Common Types of Questions in Chapter 10 Tests

Students preparing for their Form 2B exams should familiarize themselves with the types of questions frequently seen in Chapter 10 assessments:

### **1. Identifying Parts of a Circle**

- Questions asking to label or identify radius, diameter, chord, tangent, secant, segment, and sector.

### **2. Calculating Angles in Circles**

- Finding inscribed angles, angles formed by tangents and chords, or angles between secants.

### **3. Arc Lengths and Measures**

- Determining the measure of arcs or the length of an arc given radius and angle.

### **4. Cyclic Quadrilaterals**

- Applying the properties that opposite angles sum to  $180^\circ$  and using theorems related to cyclic quadrilaterals.

### **5. Coordinate Geometry in Circles**

- Using equations of circles, calculating centers, radii, or points of intersection.

### **6. Application of Theorems**

- Using theorems such as the Alternate Segment Theorem, the Tangent-Secant Theorem, or the Angle at the Center Theorem to solve problems.

## **Sample Questions and Their Answers**

Below are detailed solutions to typical Chapter 10 questions, illustrating how to approach and solve them effectively.

**Question 1: Find the measure of angle ABC, where ABC is an inscribed angle subtending an arc of  $80^\circ$ .**

**Solution:**

- Recall that an inscribed angle measures half the measure of its intercepted arc.
- Therefore, angle  $ABC = \frac{1}{2} \times 80^\circ = 40^\circ$ .

**Answer:  $40^\circ$**

**Question 2: In a circle, the diameter AB is drawn, and a point C on the circle is such that  $\angle ACB = 50^\circ$ . Find the measure of arc AB.**

**Solution:**

- Inscribed angles subtending the same arc are equal. Since AB is a diameter, angle ACB is a right angle ( $90^\circ$ ) because it subtends the semicircular arc.
- But the question states  $\angle ACB = 50^\circ$ , which suggests a different scenario; perhaps the problem involves calculating the arc subtended by angle ACB.
- Alternatively, the key property is that an inscribed angle measures half the arc it subtends.
- Since  $\angle ACB = 50^\circ$ , the arc it intercepts is  $2 \times 50^\circ = 100^\circ$ .
- The arc AB, which is opposite to point C, would then be  $360^\circ - 100^\circ = 260^\circ$ .

**Answer: The measure of arc AB is  $260^\circ$ .**

**Question 3: A circle has a radius of 7 cm. Find the length of the minor arc intercepted by a central angle of  $60^\circ$ .**

**Solution:**

- Arc length (L) =  $(\theta/360^\circ) \times 2\pi r$
- Substituting the values:

$$L = (60/360) \times 2\pi \times 7 = (1/6) \times 2\pi \times 7$$

$$= (1/6) \times 14\pi = (14\pi)/6 = (7\pi)/3 \text{ cm}$$

**Answer:  $(7\pi)/3$  cm (approximately 7.33 cm)**

**Question 4: In a cyclic quadrilateral, the angles are given as  $\angle A = 110^\circ$  and  $\angle C = 70^\circ$ . Find the measures of  $\angle B$  and  $\angle D$ .**

**Solution:**

- Opposite angles in a cyclic quadrilateral sum to  $180^\circ$ .
- Therefore:

$$\angle A + \angle C = 180^\circ$$

- Since  $\angle A = 110^\circ$ , then  $\angle C = 70^\circ$ , which confirms the cyclic nature.
- Similarly:

$$\angle B + \angle D = 180^\circ$$

- Given only  $\angle A$  and  $\angle C$ , the sum of opposite angles is confirmed, but to find  $\angle B$  and  $\angle D$ , additional data might be needed.
- If the problem states that  $\angle B = x$ , then  $\angle D = 180^\circ - x$ .

## 5. Arc Addition

- The measure of the arc formed by two adjacent arcs is the sum of their measures.

## 6. Length of an Arc

- Arc length formula as mentioned earlier.

## 7. Equations of Circles

- Draw auxiliary lines that reveal hidden relationships.
- Write logical, sequential steps leading to the conclusion.

**Sample Proof Idea:**

Prove that angles subtended by the same chord are equal:

- Draw the circle with the chord.
- Mark two inscribed angles subtended by the same chord.
- Show that these angles intercept the same arc.
- Use the inscribed angle theorem to conclude they are equal.

## Common Mistakes and How to Avoid Them

Identifying typical errors helps in refining answer strategies.

- Misapplication of Theorems: Students sometimes confuse properties of inscribed angles and central angles. Remember: central angle measure equals the intercepted arc, inscribed angles measure half the intercepted arc.
- Incorrect Diagram Interpretation: Always verify the diagram aligns with the problem statement. Misreading the figure can lead to wrong assumptions.
- Neglecting Units or Labels: Ensure all lengths, angles, and segments are correctly labeled and units are consistent.
- Overlooking Special Cases: For example, when diameters are involved, some properties simplify or change.
