The Historical Development of Organic Chemistry

Early Discoveries and the Birth of Organic Chemistry

The roots of organic chemistry trace back to the 19th century, where scientists sought to understand the nature of organic compounds. Early chemists believed that organic compounds could only be produced by living organisms, a concept known as vitalism. This belief persisted until Friedrich Wöhler's synthesis of urea in 1828 from inorganic compounds challenged the vitalist perspective and marked the beginning of modern organic chemistry.

Advancements in Structural Theory

Following Wöhler's synthesis, the understanding of molecular structures advanced rapidly. The development of structural formulas allowed chemists to visualize molecules, leading to the identification of functional groups and isomerism. The concept of valence and the establishment of structural isomerism laid the groundwork for organizing and categorizing organic compounds.
