- Using Models to Visualize Reactions: Drawing particle diagrams representing reactants and products to see atom rearrangement.

Sample Question & Approach:

Q: How do you balance a chemical equation using models?

A: By representing each molecule with a specific number of particles, then adjusting the quantities until the number of each type of particle remains consistent on both sides.

- Mole Concept and Stoichiometry

This section emphasizes the concept of the mole as a counting unit and applies it to quantify reactants and products.

- Mole Ratios: Derived from coefficients in balanced equations.
- Using Models to Visualize Molecules: Particle diagrams showing the relative number of molecules involved in reactions.

Sample Questions and Their Solutions from Unit 7 WS

Question 1:

Using models, explain why the mass of reactants equals the mass of products in a chemical reaction.

Answer:

Models show that atoms are simply rearranged during a reaction; no atoms are created or destroyed. Particle diagrams illustrate that the total number of each type of atom remains constant before and after the reaction, which aligns with the law of conservation of mass. Therefore, when representing the reaction with particles, the total mass remains unchanged because the same number and types of atoms are present on both sides.

Question 2:

Balance the following equation using visual particle models:

Answer:

Using particle diagrams:

- Represent 1 molecule of propane (C_3H_8), with 3 carbon atoms and 8 hydrogen atoms.
- Represent oxygen molecules (O_2) as pairs of oxygen atoms.
- Show that balancing carbons requires 3 (CO_2) molecules, each with 1 carbon.
- Balancing hydrogens requires 4 (H_2O) molecules.
- Count oxygen atoms on both sides:
- Reactants: O_2 molecules needed = (3×2) (from CO_2) + (4×1) (from H_2O) = $6 + 4 = 10$ oxygen atoms, so 5 (O_2) molecules.
- Final balanced equation:

Visual models confirm the atom counts and mass balance.
