Mini Project on Speech Processing Using MATLAB

Speech processing is a fascinating area within digital signal processing that involves the analysis, synthesis, and recognition of human speech signals. With advancements in technology, MATLAB has emerged as a popular tool for developing speech processing applications due to its robust signal processing toolbox, ease of use, and comprehensive simulation environment. This article provides an in-depth guide on creating a mini project on speech processing using MATLAB, covering essential concepts, step-by-step procedures, and implementation tips to help beginners and intermediate users develop effective speech processing applications.

Introduction to Speech Processing

Speech processing encompasses various techniques aimed at analyzing and manipulating speech signals for applications such as speech recognition, speaker identification, noise reduction, and speech synthesis. The core idea involves converting analog speech signals into digital form, processing them through algorithms, and then interpreting or synthesizing speech as needed.

Why Use MATLAB for Speech Processing?

MATLAB offers several advantages for speech processing projects:

- **Rich Toolboxes:** MATLAB's Signal Processing Toolbox simplifies tasks like filtering, Fourier analysis, and spectral analysis.
- **Ease of Visualization:** Built-in plotting functions allow for real-time visualization of signals and processing results.
- **Simulation Environment:** MATLAB provides a flexible environment for testing algorithms without requiring hardware implementation.
- **Community and Resources:** Extensive user community and tutorials facilitate troubleshooting and learning.

Core Components of the Mini Project

The mini project typically involves the following stages:

- **Data Acquisition:** Recording or importing speech signals.
- **Preprocessing:** Noise removal, normalization, and framing.

- **Feature Extraction:** Deriving meaningful features like MFCC or LPC coefficients.
- **Speech Recognition or Classification:** Using features for recognizing spoken words or speaker identification.
- **Post-processing and Visualization:** Presenting results and refining the process.

This guide focuses on creating a simple speech recognition system using feature extraction and pattern matching.

Step-by-Step Guide to Developing the Mini Project

1. Setting Up MATLAB Environment

Begin by installing MATLAB and ensuring the Signal Processing Toolbox is available. Create a new script or live script for your project.

2. Data Collection and Import

You can record speech directly using MATLAB or import existing audio files (.wav format). For example:

```matlab

[audioIn, fs] = audioread('sample_speech.wav');

sound(audioIn, fs);

```

Ensure audio files are mono and of sufficient quality for analysis.

3. Preprocessing

Preprocessing enhances the quality of speech signals and prepares data for feature extraction.

- **Noise Removal:** Apply filters like low-pass or band-pass filters to eliminate unwanted noise.
- **Normalization:** Adjust the amplitude to a standard level.
- **Framing:** Divide the speech signal into overlapping frames to analyze short-time features.

Example code for framing:

```matlab

frameSize = 256; % in samples

overlap = 128; % in samples

frames = buffer(audioIn, frameSize, overlap, 'nodelay');

```

4. Feature Extraction

Feature extraction captures the essential characteristics of speech signals. Common features include Mel-Frequency Cepstral Coefficients (MFCC), Linear Predictive Coding (LPC), and Spectral features.

MFCC Extraction Example:

```matlab

% Use MATLAB's built-in mfcc function (requires Audio Toolbox)

coeffs = mfcc(audioIn, fs);

plot(coeffs);

title('MFCC Features');

```

This process involves:

- Windowing each frame
- Applying Fourier Transform
- Mapping to Mel scale
- Applying Discrete Cosine Transform

LPC Extraction Example:

```matlab
```

```
order = 12; % LPC order

lpcCoeffs = lpc(audioIn, order);
```

5. Pattern Matching and Recognition

Once features are extracted, implement a simple classifier such as Euclidean distance matching or a pre-trained neural network for recognizing speech.

Example: Euclidean Distance Matching

Suppose you have stored feature vectors for known words:

```matlab
% Known feature vectors

knownFeatures = [featureVector1; featureVector2; featureVector3];

% New feature vector

newFeature = mean(coeffs, 1);

% Calculate distances

distances = sqrt(sum((knownFeatures - newFeature).^2, 2));

% Find the closest match

[~, index] = min(distances);

disp(['Recognized Word: ', knownWords{index}]);
```

For more advanced recognition, consider using MATLAB's Pattern Recognition Toolbox or machine learning classifiers like SVM or neural networks.

Visualizing Results

Visualization helps interpret speech signals and processing results:

- Waveform plots for raw and processed signals.
- Spectrograms for time-frequency analysis.
- Feature plots such as MFCC coefficient trajectories.

Example of spectrogram:

```matlab

spectrogram(audioIn, hamming(256), 128, 256, fs, 'yaxis');

title('Spectrogram of Speech Signal');

```

Enhancements and Advanced Features

- Noise Robustness: Implement noise reduction algorithms like spectral subtraction.
- Real-time Processing: Use MATLAB's app designer or Simulink for real-time speech analysis.
- Speaker Identification: Extend the project to recognize individual speakers.
