Foundations of Probability in Hines and Montgomery's Framework

Basic Concepts of Probability

Probability is the measure of the likelihood that an event will occur. Hines and Montgomery emphasize understanding probability as a mathematical foundation for dealing with uncertainty. Key concepts include:

- Sample Space (S): The set of all possible outcomes.
- Event (E): A subset of the sample space.
- Probability of an Event (P(E)): A number between 0 and 1 representing the likelihood of E occurring.

They introduce the axioms of probability, which are:

- Non-negativity: $P(E) \geq 0$ for any event E.
- Normalization: $P(S) = 1$.
- Additivity: For mutually exclusive events E_1 and E_2 , $P(E_1 \cup E_2) = P(E_1) + P(E_2)$.

Conditional Probability and Independence

Conditional probability considers the likelihood of an event given that another event has occurred:

$$P(E|F) = \frac{P(E \cap F)}{P(F)}$$

Where $P(E|F)$ is the probability of E given F , and $P(E \cap F)$ is the joint probability of E and F .

Two events E and F are independent if:

$$P(E \cap F) = P(E) \times P(F)$$

Hines and Montgomery highlight the importance of understanding these concepts for modeling real-world processes where outcomes depend on prior conditions.

Bayes' Theorem

Bayes' theorem is fundamental for updating probabilities based on new evidence:

$$P(E|F) = \frac{P(F|E) \times P(E)}{P(F)}$$

This theorem is extensively used in fields such as quality control, diagnostics, and machine learning, which are covered in their statistical approaches.
