Sample Review Questions and Their Answers

Below are examples of common questions you might find on a review sheet for Unit 13, along with comprehensive answers.

Question 1: What is the VSEPR theory, and how does it predict molecular shapes?

Answer:

Valence Shell Electron Pair Repulsion (VSEPR) theory states that electron pairs around a central atom will arrange themselves as far apart as possible to minimize repulsion. This arrangement determines the molecule's shape. For example, if there are two bonding pairs and no lone pairs, the molecule adopts a linear shape. If there are three bonding pairs and one lone pair, the shape becomes trigonal pyramidal, as in ammonia (NH₃). VSEPR helps predict shapes such as tetrahedral, trigonal planar, bent, trigonal bipyramidal, and octahedral, based on the number of electron pairs.

Question 2: How can you determine if a molecule is polar or nonpolar?

Answer:

To determine molecular polarity, follow these steps:

- Draw the Lewis structure of the molecule.
- Determine the polarity of individual bonds based on differences in electronegativity.
- Use VSEPR to identify the molecule's shape.
- Analyze the symmetry of the molecule: symmetric molecules with polar bonds (like CO₂) tend to be nonpolar, while asymmetric molecules (like H₂O) are polar.
- The overall dipole moment indicates the molecule's polarity; a non-zero dipole moment means the molecule is polar.

Question 3: What are intermolecular forces, and why are they important?

Answer:

Intermolecular forces are attractions between molecules that influence physical properties such as boiling point, melting point, and solubility. The main types include:

- London dispersion forces: weak forces present in all molecules, especially significant in nonpolar molecules.
- Dipole-dipole interactions: occur between polar molecules.
- Hydrogen bonds: strong dipole-dipole attractions involving hydrogen bonded to electronegative atoms like N, O, or F.

These forces determine how substances behave in different states and environments.

- The equilibrium constant (K_{eq}) remains constant at a given temperature.

Analysis:

This answer correctly emphasizes the dynamic nature of equilibrium and the importance of constant concentrations. A common misconception is that reactions stop at equilibrium, which is false; they continue at equal rates.

2. Expression of the Equilibrium Constant (K_{eq})

Question: How is (K_{eq}) written for the reaction:

Typical Answer:

$$K_{eq} = \frac{[C]^c [D]^d}{[A]^a [B]^b}$$

Analysis:

This expression correctly reflects the law of mass action. It is vital to note that the concentrations are typically equilibrium concentrations, not initial or any other state.

3. Effect of Temperature on Equilibrium

Question: How does increasing temperature affect the equilibrium position?

Typical Answer:

The effect depends on whether the reaction is endothermic or exothermic:

- For endothermic reactions, increasing temperature shifts the equilibrium to the right (favoring products).
- For exothermic reactions, increasing temperature shifts the equilibrium to the left (favoring reactants).

Analysis:

This answer correctly applies Le Châtelier's principle. A common mistake is to assume the same shift regardless of reaction type, highlighting the importance of understanding reaction enthalpy.

4. Calculating Solubility Product (K_{sp})

Question: Given the initial ion concentrations, calculate K_{sp} .

Typical Answer:

Set up an ICE table, determine the molar solubility, and apply the K_{sp} expression. For example, for

if initial concentrations are known, solve for the equilibrium concentrations and compute

$$K_{sp} = [A^{3+}][B^{-}]^2$$

Analysis:

This process underscores the importance of systematic problem-solving and accurate algebra. Errors often occur in the ICE table setup or arithmetic steps.
