Sample Questions and Detailed Answer Explanations

Below are common types of questions found on the Regents Biology Evolution Test, complete with detailed answer keys and explanations.

Question 1: Which of the following best explains how natural selection can lead to evolution?

- A. Individuals acquire traits during their lifetime and pass them to offspring.
- B. Random genetic mutations occur, and beneficial mutations increase in frequency over generations.
- C. All members of a population are equally likely to survive and reproduce.
- D. Organisms intentionally change their traits to adapt to their environment.

Correct Answer: B

Explanation:

Natural selection involves random genetic mutations?changes in DNA?that may confer advantages or disadvantages. Beneficial mutations increase an organism?s fitness, leading to higher reproductive success and, over generations, changes in the population?s gene pool. Option A describes Lamarckism, which is largely discredited. Option C describes a non-selective scenario, and D implies intentionality, which is not how evolution occurs. Therefore, B accurately describes the process.

Question 2: Based on fossil evidence, scientists have observed that species have changed over time. How does this support the theory of evolution?

Answer:

Fossil evidence demonstrates gradual changes in species? physical structures over millions of years. The presence of transitional fossils?such as Archaeopteryx bridging reptiles and birds?provides concrete proof of evolutionary processes. These fossils show a chronological sequence of gradual modifications, supporting the idea that species have evolved from common ancestors. This evidence aligns with Darwin?s theory of descent with modification, confirming that evolution is a real and ongoing process.

Question 3: Examine the following diagram showing the beak sizes of finch populations before and after drought conditions. Which statement best explains the change in the population?s beak size?

Diagram shows a shift toward larger beak sizes after drought.

- A. The environment selected for finches with larger beaks because they could crack harder seeds.
- B. Finches with smaller beaks had higher survival rates during drought.
- C. Beak size did not influence survival; the change was due to mutation alone.
- D. The beak size variation was random and not affected by environmental conditions.

Correct Answer: A

Explanation:

The drought likely reduced the availability of soft seeds, leaving harder seeds as the primary food source. Finches with larger, stronger beaks could more effectively crack these seeds, giving them a survival advantage. Over time, this selection pressure caused the population?s average beak size to

increase. This example illustrates natural selection driven by environmental factors.

Multiple Choice Sample Question

Question:

Which of the following best explains why a cell's membrane is considered semi-permeable?

- A) It allows all substances to pass freely.
- B) It blocks all substances from entering or leaving the cell.
- C) It permits some substances to pass while blocking others.
- D) It only allows water to pass through.

Answer: C) It permits some substances to pass while blocking others.

Short Answer Sample Question

Question:

Describe the role of the nucleus in a eukaryotic cell. Include in your answer the types of molecules it contains and their functions.

Sample Response:

The nucleus acts as the control center of a eukaryotic cell. It contains the cell's DNA, which carries genetic information necessary for cell activities and reproduction. The nucleus also contains nucleolus, where ribosomes are assembled. Its primary functions include regulating gene expression, controlling cell growth, and coordinating cell division.

Extended Response Sample Question

Question:

Explain how natural selection can lead to the evolution of a species. Use an example to support your explanation.

Sample Response:

Natural selection leads to evolution when individuals with advantageous traits are more likely to survive and reproduce, passing those traits to their offspring. Over generations, these traits become more common in the population. For example, in a population of birds, if some have beaks better suited for cracking hard seeds, those birds are more likely to survive during food shortages. Their offspring inherit the stronger beak trait, and over time, the species' beak morphology may evolve to be larger and stronger.
